Maternal Mortality

- Obstetrical Hemorrhage -

Identify
Patients at
Risk

Multidisciplinary
“Hemorrhage
protocol”

Clinical
management
of PPH

Maternal Mortality

- Obstetrical Hemorrhage -

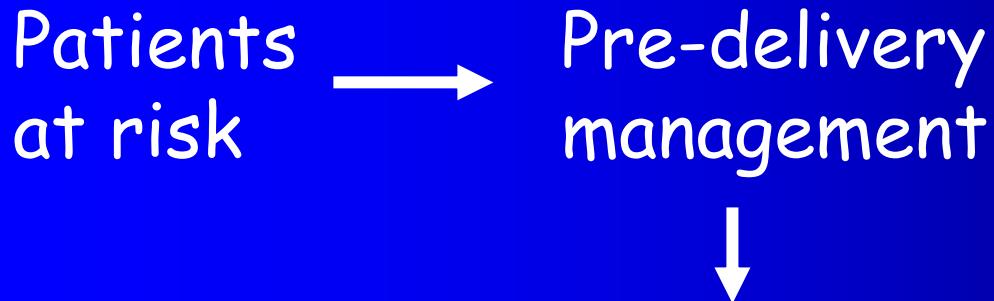

**1.-Identify
pat. at risk**

- Placenta previa/accreta*
- Anticoagulation Rx*
- Coagulopathy*
- Overdistended uterus*
- Grand multiparity*
- Abn labor pattern*
- Chorioamnionitis*
- Large myomas*
- Previous history of PPH*

Maternal Mortality

- Obstetrical Hemorrhage -

- 1.- Prepare for PPH*
- 2.- Optimize patient's hemodynamic status*
- 3.- Timing of Delivery*
- 4.- Surgical planning*
- 5.- Anesthesia / I.V. access/ invasive monitoring*
- 6.- Modify obstetrical management*
- 7.- Increased postpartum/postop surveillance*

Maternal Mortality

- Obstetrical Hemorrhage -

1. - Prepare for PPH

Personel

- Nursing
- Anesthesia
- Surg assistance
- Others (I.R.)

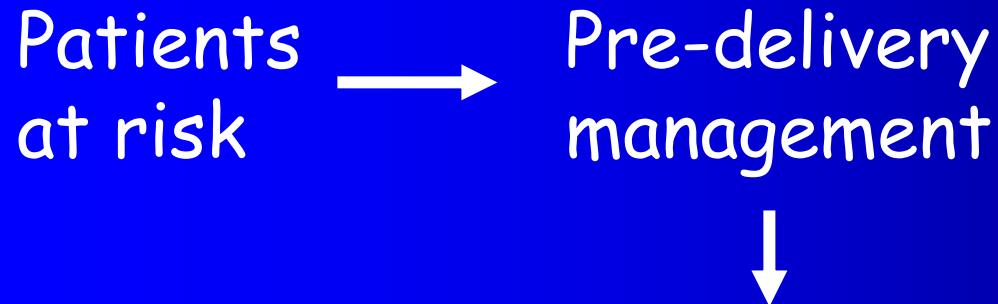

Drugs/Equipment

- Methergine
- Hemabate
- Cytotec
- Colloids
- Blood/BI.products
- Surg. Instruments
- Hemostatic balloons
(Cook, S-B, Foley)

Maternal Mortality

- Obstetrical Hemorrhage -

- 1.- *Prepare for PPH*
- 2.- *Optimize patient's hemodynamic status*
- 3.- *Timing of Delivery*
- 4.- *Surgical planning*
- 5.- *Anesthesia /I.V. access/ invasive monitoring*
- 6.- *Modify obstetrical management*
- 7.- *Increased postpartum/postop surveillance*

Maternal Mortality

- Obstetrical Hemorrhage -

2.- Optimize hemodynamic status

- 1.- Acute isovolemic hemodilution**
- 2.- Acute hypervolemic hemodilution**
- 3.- Autologous donation**
- 4.- Preoperative transfusion**

Maternal Mortality

- Obstetrical Hemorrhage -

Acute
hemodilution

Decreases pre-op
Hb concentration

*For same blood
volume lost*

Lower RBC's loss

- ↓Transfusion rates

- ↑Final Hct's

Maternal Mortality

- Obstetrical Hemorrhage -

1.- Acute isovolemic hemodilution

Withdraw 2-4u. of Blood

Replace the volume with crystaloids

Lower the pre-op Hct

Replace the blood at end of surgery

2.- Acute hypervolemic hemodilution

Admin 1500-2000cc Crystaloids

Hemodilution (Lowers pre-op Hct)

Maternal Mortality

- Obstetrical Hemorrhage -

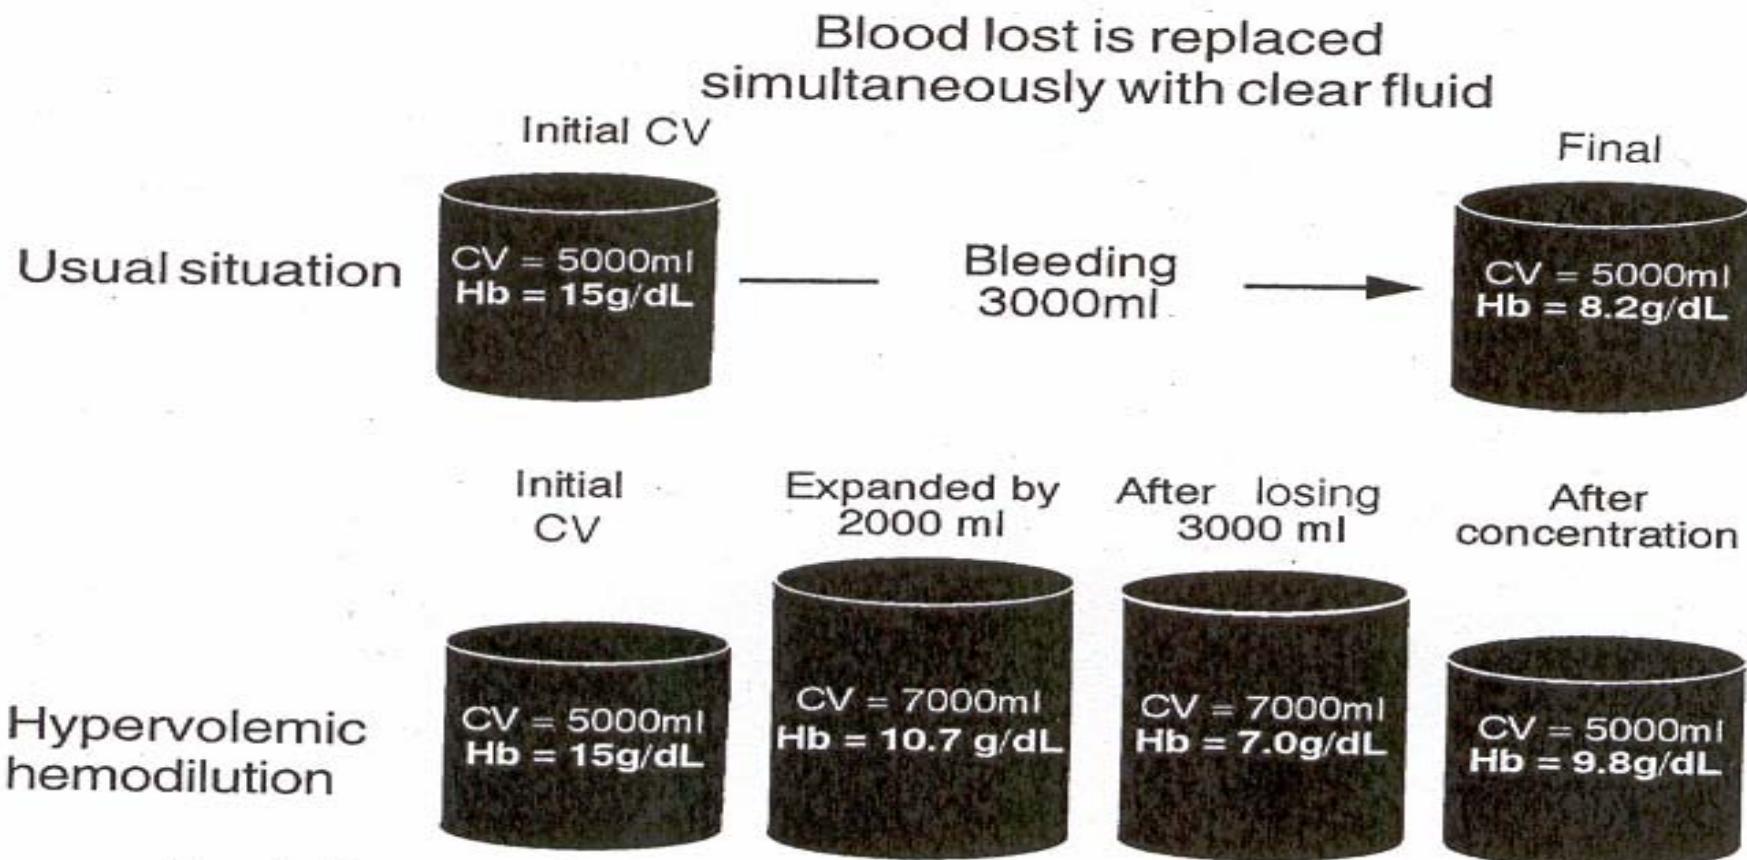

FIG. 4. Postoperative Hb gain in hypervolemic hemodilution.

Maternal Mortality

- Obstetrical Hemorrhage -

- Acute isovolemic/hypervolemic hemodilution

Initial Hb

Preop 45% → 15g Hb%

Blood loss

2,000cc

Hb loss

300g → (27%)

↓
After hemodilution

Preop 30% → 10g Hb%

3,000cc

300g → (27%)

Maternal Mortality

- Obstetrical Hemorrhage -

Blood lost is replaced simultaneously with clear fluid

Isovolemic hemodilution

Hypervolemic hemodilution

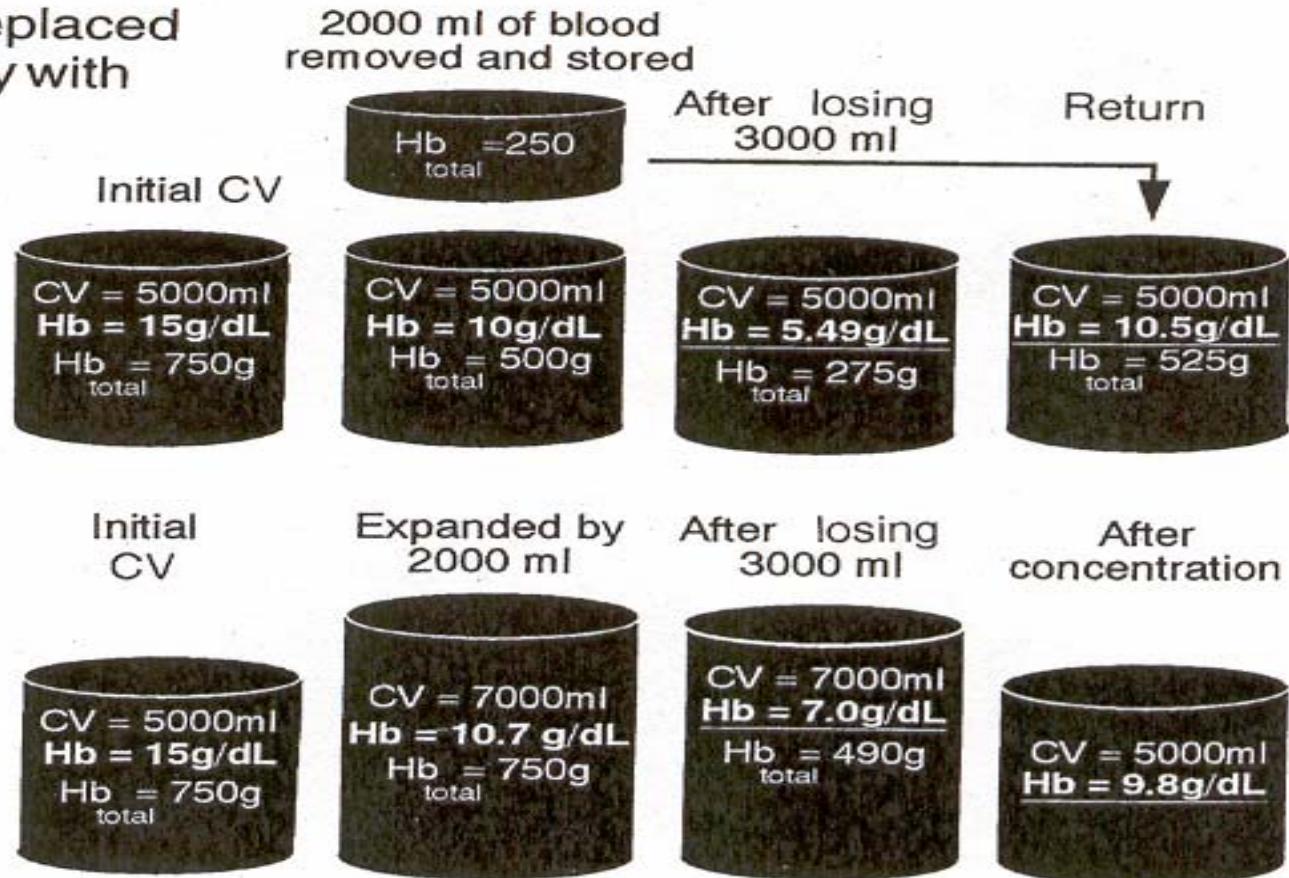

FIG. 6. Comparison of hypervolemic hemodilution with isovolemic hemodilution.

Maternal Mortality

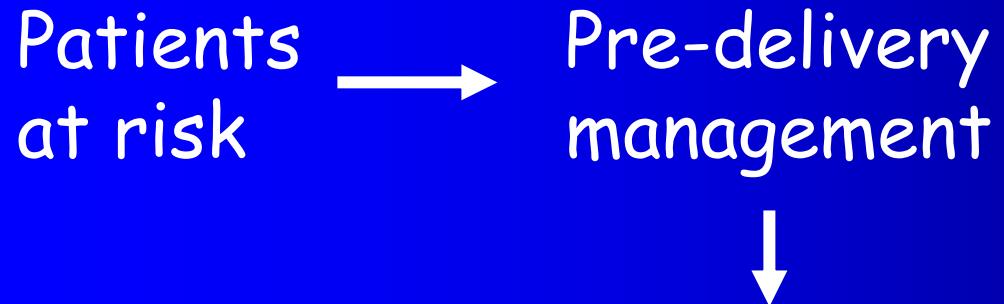

- Obstetrical Hemorrhage -

Optimize hemodynamic status

- 1.- *Acute isovolemic hemodilution***
- 2.- *Acute hypervolemic hemodilution***
- 3.- *Autologous donation***
- 4.- *Preoperative transfusion***

Maternal Mortality

- Obstetrical Hemorrhage -

- 1.- *Prepare for PPH*
- 2.- *Optimize patient's hemodynamic status*
- 3.- *Timing of Delivery*
- 4.- *Surgical planning*
- 5.- *Anesthesia /I.V. access/ invasive monitoring*
- 6.- *Modify obstetrical management*
- 7.- *Increased postpartum/postop surveillance*

Maternal Mortality

- Obstetrical Hemorrhage -

3. - Timing of Delivery

- Placenta previa
- Prev classical
- Prev myomectomy
- Tumor previa

Schedule C/S

- 36-37wks after Amnio for FLM
- >37 wks if Amnio not possible

*Avoids uterine rupture
A avoids significant hemorrhage*

Maternal Mortality

- Obstetrical Hemorrhage -

Patients at risk → Pre-delivery management

- 1.- *Prepare for PPH*
- 2.- *Optimize patient's hemodynamic status*
- 3.- *Timing of Delivery*
- 4.- *Surgical planning*
- 5.- *Anesthesia /I.V. access/ invasive monitoring*
- 6.- *Modify obstetrical management*
- 7.- *Increased postpartum/postop surveillance*

Maternal Mortality

- Obstetrical Hemorrhage -

4. - Surgical planning

Realistic assessment of a significant PPH episode

- Wants to avoid TAH ? (religious/cultural)
- Inability to transfuse ? (Jehovah's witness, etc)
- Desires subsequent pregnancies ?
- Tolerates poorly large hemodynamic shifts

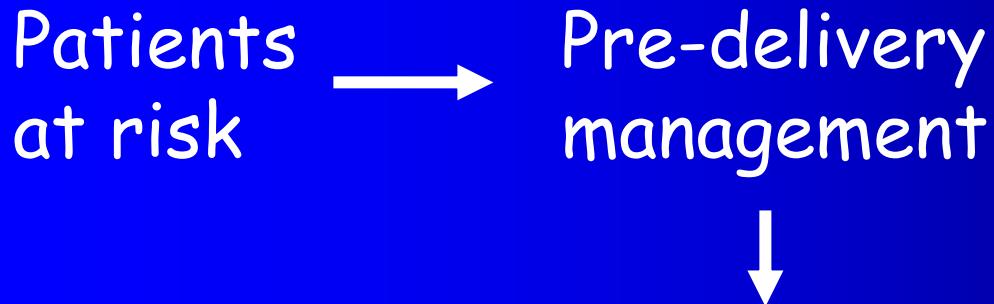

↑Bleeding → TAH

More Surgery/Embolization
More Transfusion.

TAH

Maternal Mortality

- Obstetrical Hemorrhage -

- 1.- Prepare for PPH*
- 2.- Optimize patient's hemodynamic status*
- 3.- Timing of Delivery*
- 4.- Surgical planning*
- 5.- Anesthesia /I.V. access/ invasive monitoring*
- 6.- Modify obstetrical management*
- 7.- Increased postpartum/postop surveillance*

Maternal Mortality

- Obstetrical Hemorrhage -

4. - Anesthesia / I.V. Access

Obtain Anesthesia consult

- Type of anesthesia
- Need for invasive monitoring (A line, S-G monitoring, etc)

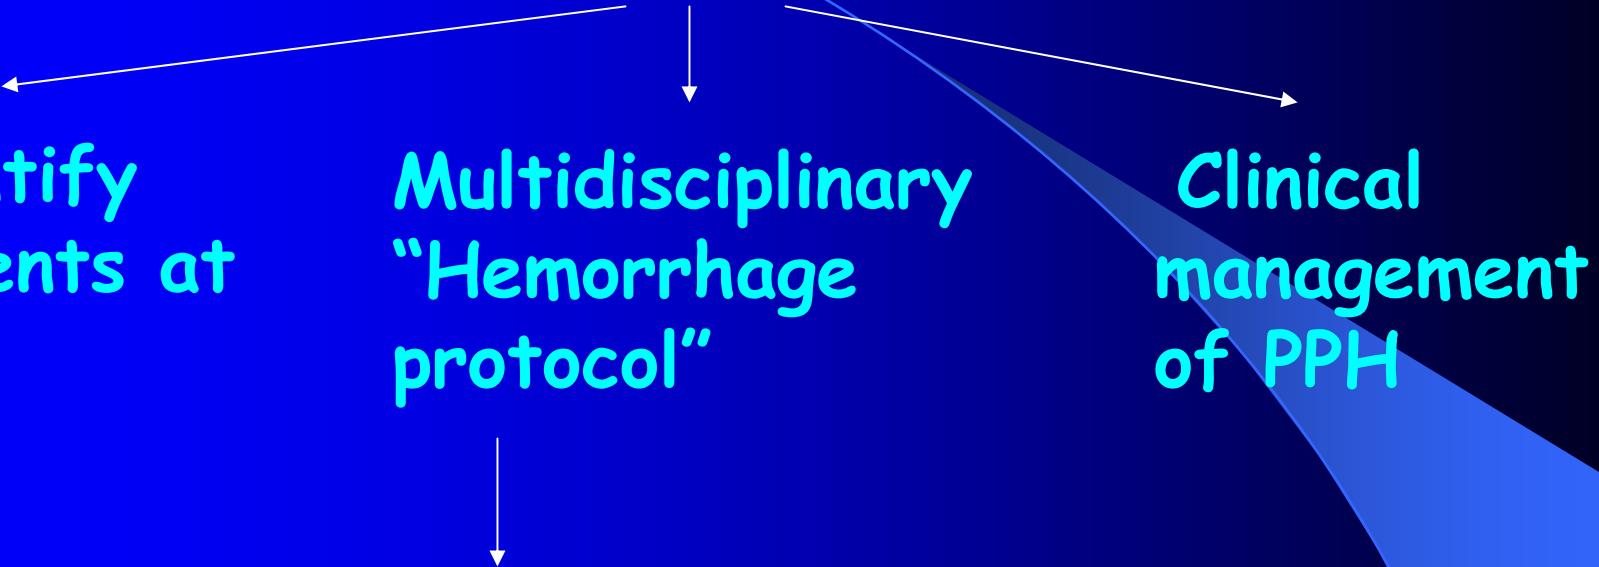

Maternal Mortality

- Obstetrical Hemorrhage -

**Identify
Patients at
Risk**

**Multidisciplinary
“Hemorrhage
protocol”**

**Clinical
management
of PPH**

- 
- 1.- How/Who triggers the "H.P."*
 - 2.- Identify "The response team"*
 - 3.- Transfusion protocol*
 - 4.- Define the logistics involved*
 - 5.- Conduct drills*
 - 6.- Post-op care*

Maternal Mortality

- Obstetrical Hemorrhage -

Identify
Patients at
Risk

Multidisciplinary
“Hemorrhage
protocol”

Clinical
management
of PPH

1. - How/Who triggers the "H.P."

- Labor & Delivery
- Postpartum floor
- Antepartum floor
- E.D.

→ RN's, CNM's, PA's, MD's

Code "H"

Operator

→ Response
Team

Maternal Mortality

- Obstetrical Hemorrhage -

Identify
Patients at
Risk

Multidisciplinary
“Hemorrhage
protocol”

Clinical
management
of PPH

2. - *The “Response Team”*

- Nursing
- Anesthesia
- Ob surgery (MFM, Gyn Onc, Ob-Gyn,)
- Intervention Radiology
- Urology
- Hematology

Maternal Mortality

- Obstetrical Hemorrhage -

**Identify
Patients at
Risk**

**Multidisciplinary
“Hemorrhage
protocol”**

**Clinical
management
of PPH**

3. - Transfusion Protocol

- Immediate release of O neg Blood if required*
- How fast can Crossmatched blood be made available*
- Physical transport of Blood → O.R. and samples O.R. → Lab/Blood Bank*

Maternal Mortality

- Obstetrical Hemorrhage -

**Identify
Patients at
Risk**

**Multidisciplinary
“Hemorrhage
protocol”**

**Clinical
management
of PPH**

4. - Logistics

Hospital specific
- Define responsibilities

Maternal Mortality

- Obstetrical Hemorrhage -

**Identify
Patients at
Risk**

**Multidisciplinary
“Hemorrhage
protocol”**

**Clinical
management
of PPH**

5. - Drills

- Conduct Drills 3-4 x/year*
- Evaluate the performance*
- Review the results with the entire team*

Maternal Mortality

- Obstetrical Hemorrhage -

**Identify
Patients at
Risk**

**Multidisciplinary
“Hemorrhage
protocol”**

**Clinical
management
of PPH**

6. - Postoperative care

*Insures a smooth transition from the O.R./L&D to the appropriate level of care unit
→ In most hospitals L&D/Postpartum units not ideal for these patients*

Maternal Mortality

- Obstetrical Hemorrhage -

Identify
Patients at
Risk

Multidisciplinary
“Hemorrhage
protocol”

Clinical
management
of PPH

Diagnosis

- Early shock
- Severity of Shock

Treatment

- Insure hemostasis
- Adequate replacement

Maternal Mortality

- Obstetrical Hemorrhage -

Significant PPH

Etiology

- Uterine atony
- Placenta previa/accreta
- Cervico-vag tears
- Uterine rupture
- Coagulopathy*

* Any major hemorrhage → Coagulopathy → Bleeding

Maternal Mortality

- Obstetrical Hemorrhage -

Significant PPH

- Uterine massage
- ↑ I.V. fluids
- Empty bladder
- Oxytoxic Agents

→

- Methergine 0.2mg
- Carboprost 250µg
- Cytotec 800-1000µg

⊕ Hemostasis

∅ Hemostasis

Surgery/Embolization

Maternal Mortality

- Obstetrical Hemorrhage -

Significant PPH

Failed Medical Rx

Ut Atony/Tears

- B-Lynch procedure
- Uterina a. ligation
- Stepwize devascularization
- Uterine repair
- U.A.E.

TAH

Pl previa/accreta

- Local mattress sutures
- Hemostatic balloons
- U.A.E.
- Conserv Rx of Pl accreta

TAH

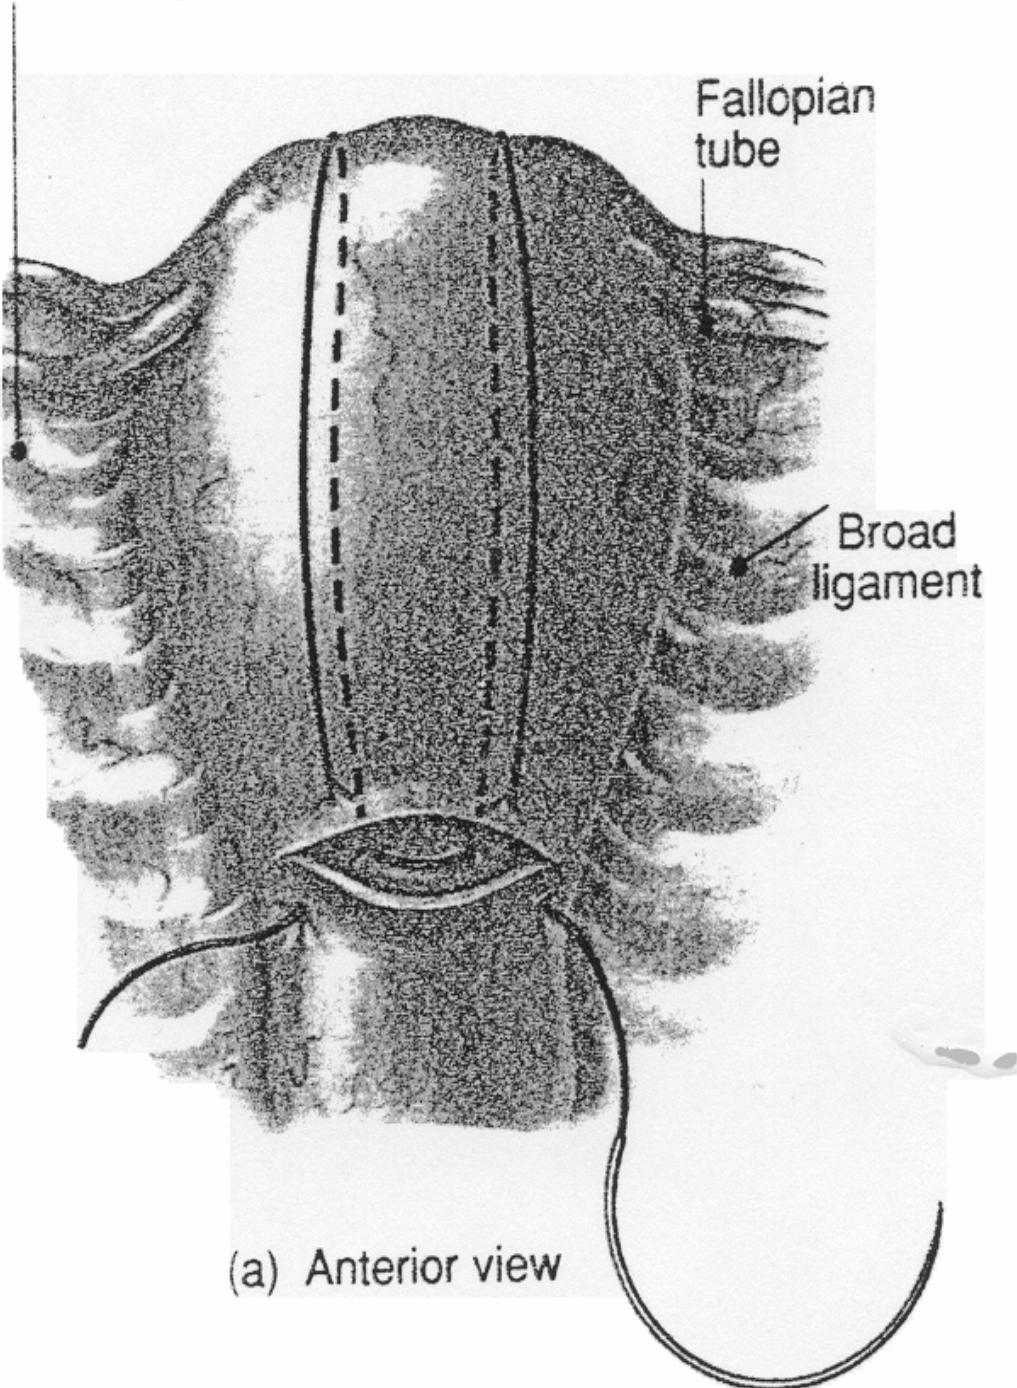

Maternal Mortality

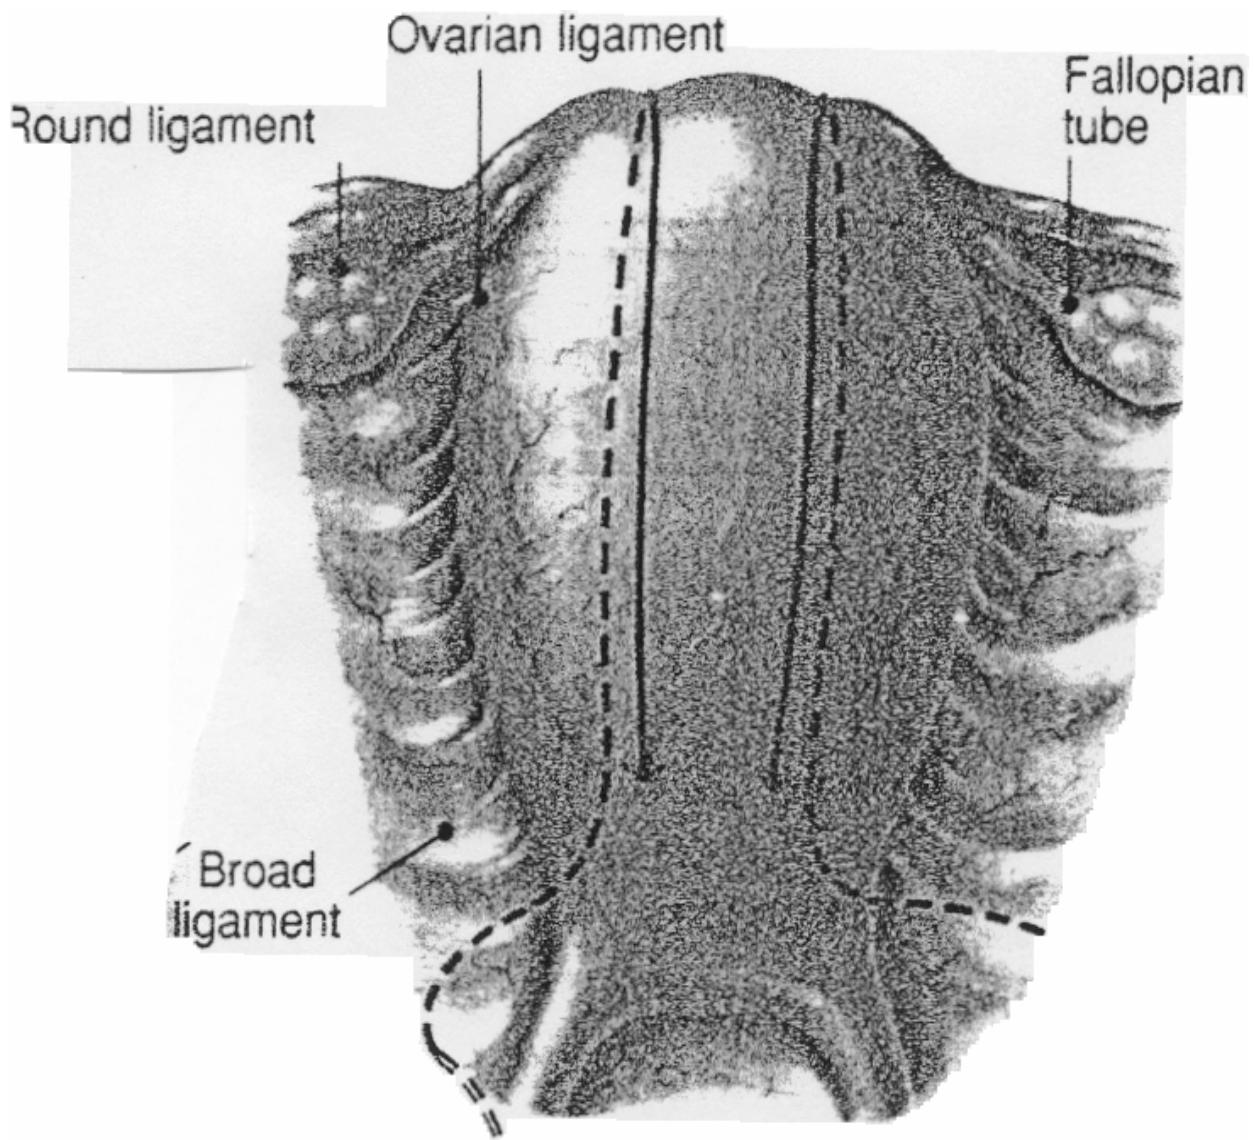

- Obstetrical Hemorrhage -

Five cases of massive life threatening postpartum hemorrhage were managed by the use of the "B-Lynch surgical technique.

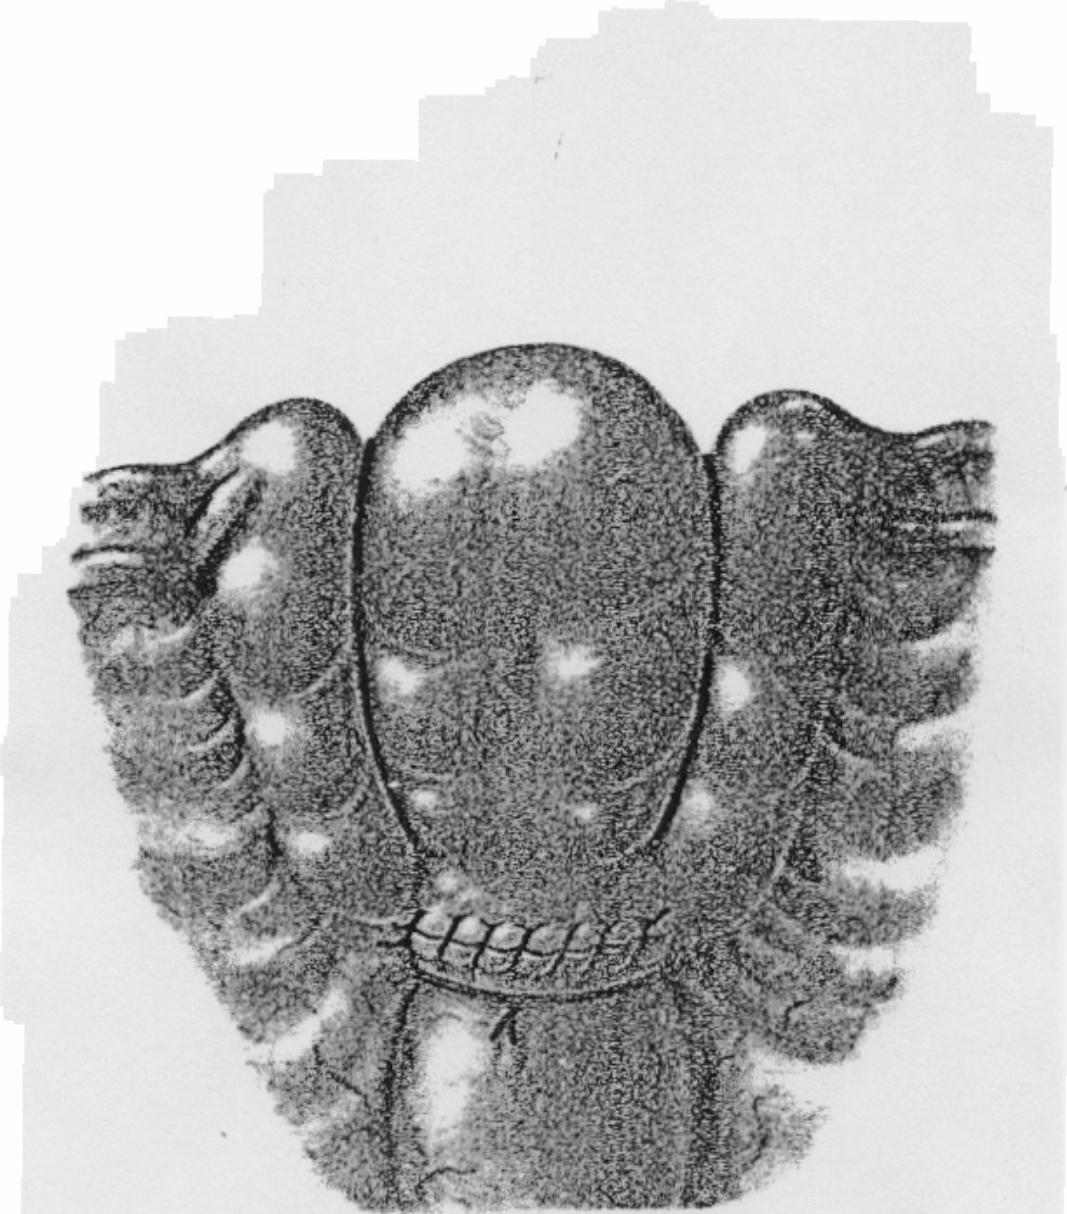

Christopher B-Lynch Br J Ob Gyn 1997

Round ligament

(b) Posterior view

(c) Anterior view

Maternal Mortality

- Obstetrical Hemorrhage -

Hypogastric artery ligation

- Decreases Blood Flow by → 48%
- Controls Severe P.P.H. in → 50% of cases

Clark et al Ob-Gyn 1985

Maternal Mortality

- Obstetrical Hemorrhage -

Uterine artery ligation

Over a 30 yr period 256 Ut artery ligation were performed for PPH.

- Successful 256 cases
- Failed 10 cases

O'Leary, J J Reprod Med 1995

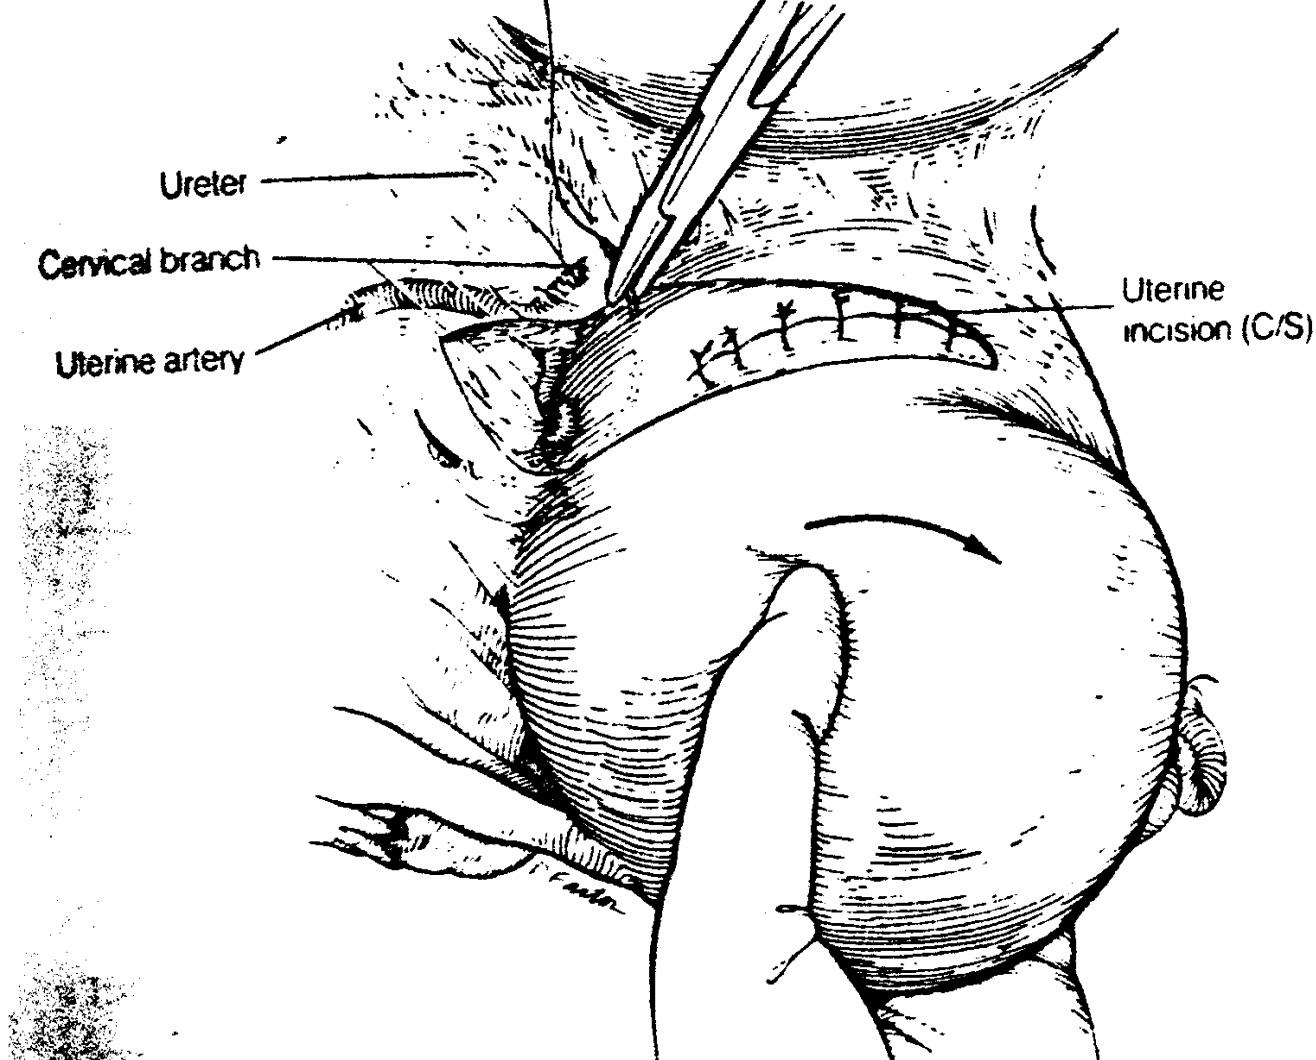

Figure 2

The uterus is tilted to the side to expose the vessels, and the ligature is placed 2–3 cm inferior to the incision. It includes 2–3 cm of uterine wall.

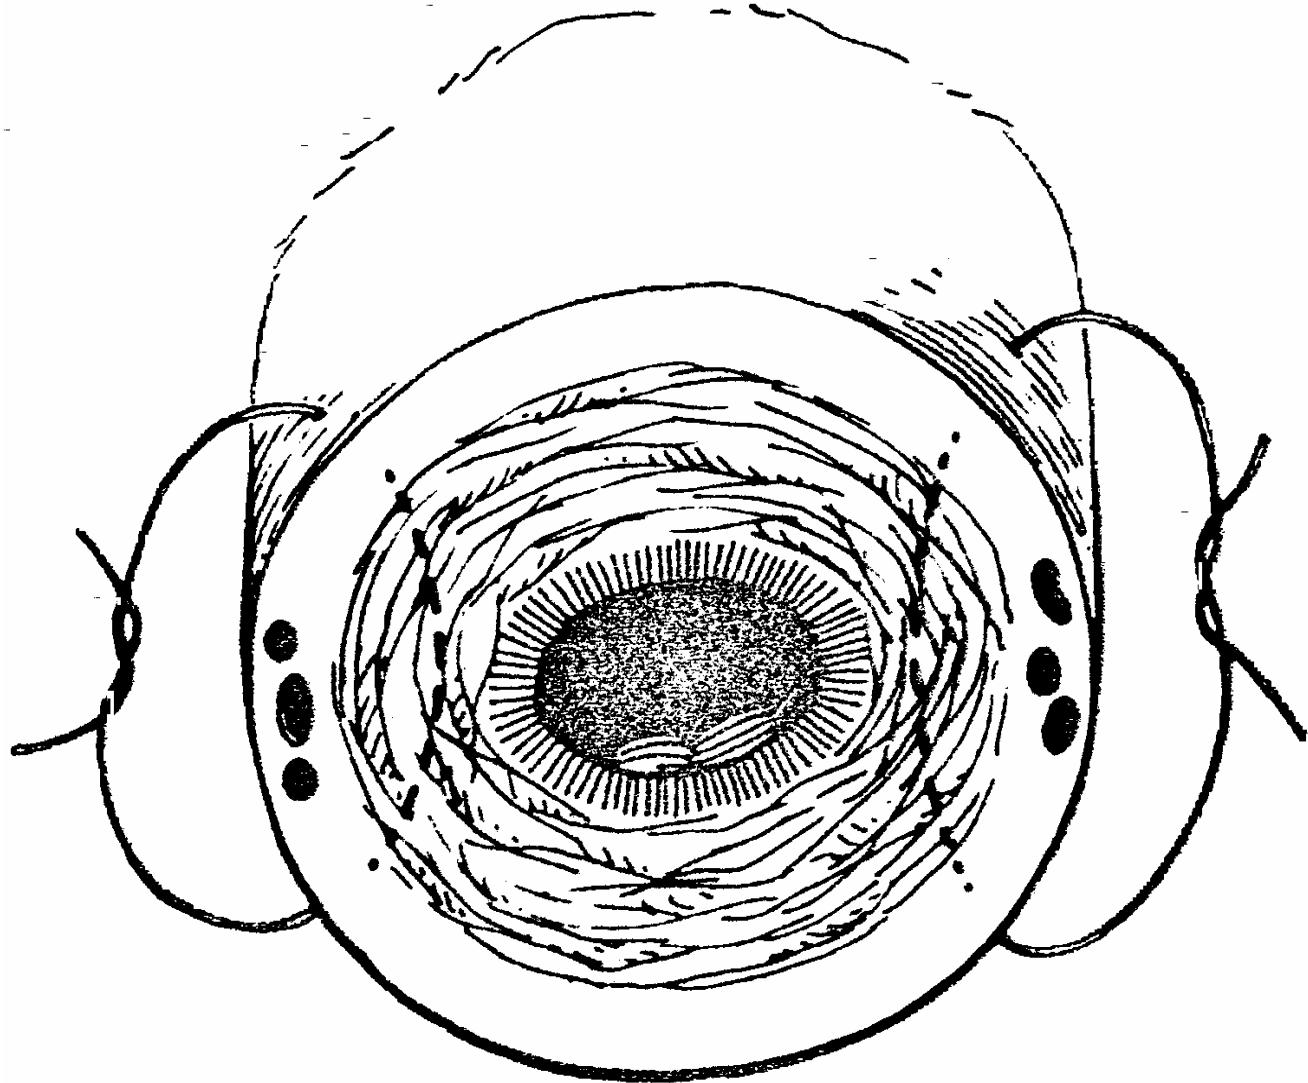

Figure 3

A coronal view of the lower uterine segment. The suture is inserted into the substance of the cervix without entering the uterine cavity and medial to the blood vessels.

Maternal Mortality

- Obstetrical Hemorrhage -

Stepwise uterine devascularization was performed for 103 patients to control intractable postpartum hemorrhage not responding to classic management

S.A. AbdRabbo Am J Ob Gyn 1994

Maternal Mortality

- Obstetrical Hemorrhage -

Indication

Patients (n=103)

Uterine atony	66(63%)
Placenta previa	7(7%)
Abruption placenta	17(16%)
Couvelaire uterus	9(10%)
D.I.C.	4(4%)

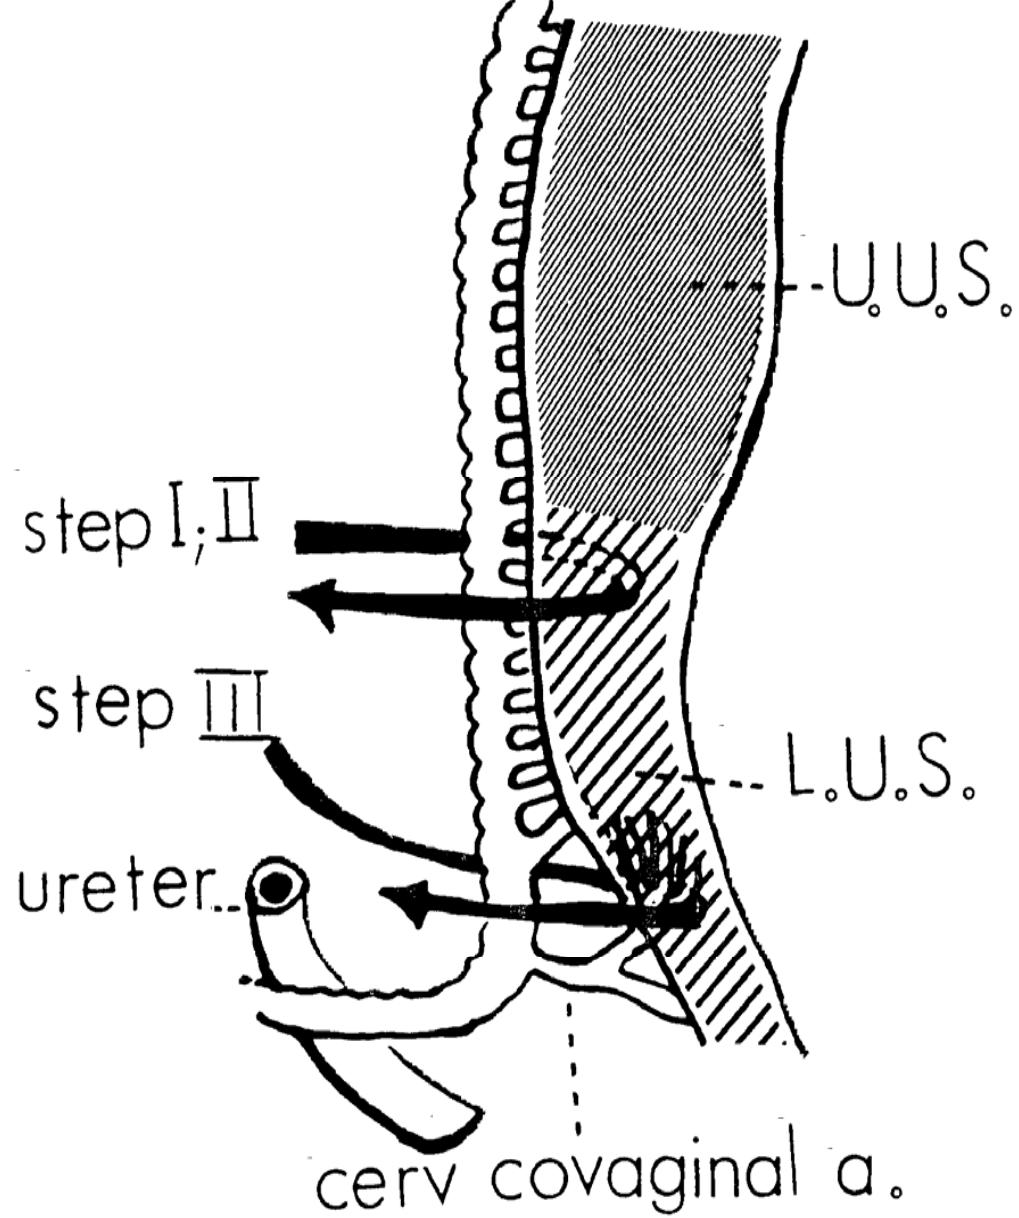

Fig. 1. Sites of uterine artery ligation in steps 1, 2 (*upper* arrow), and 3 (*lower* arrow). *U.U.S.*, Upper uterine segment; *L.U.S.*, Lower uterine segment.

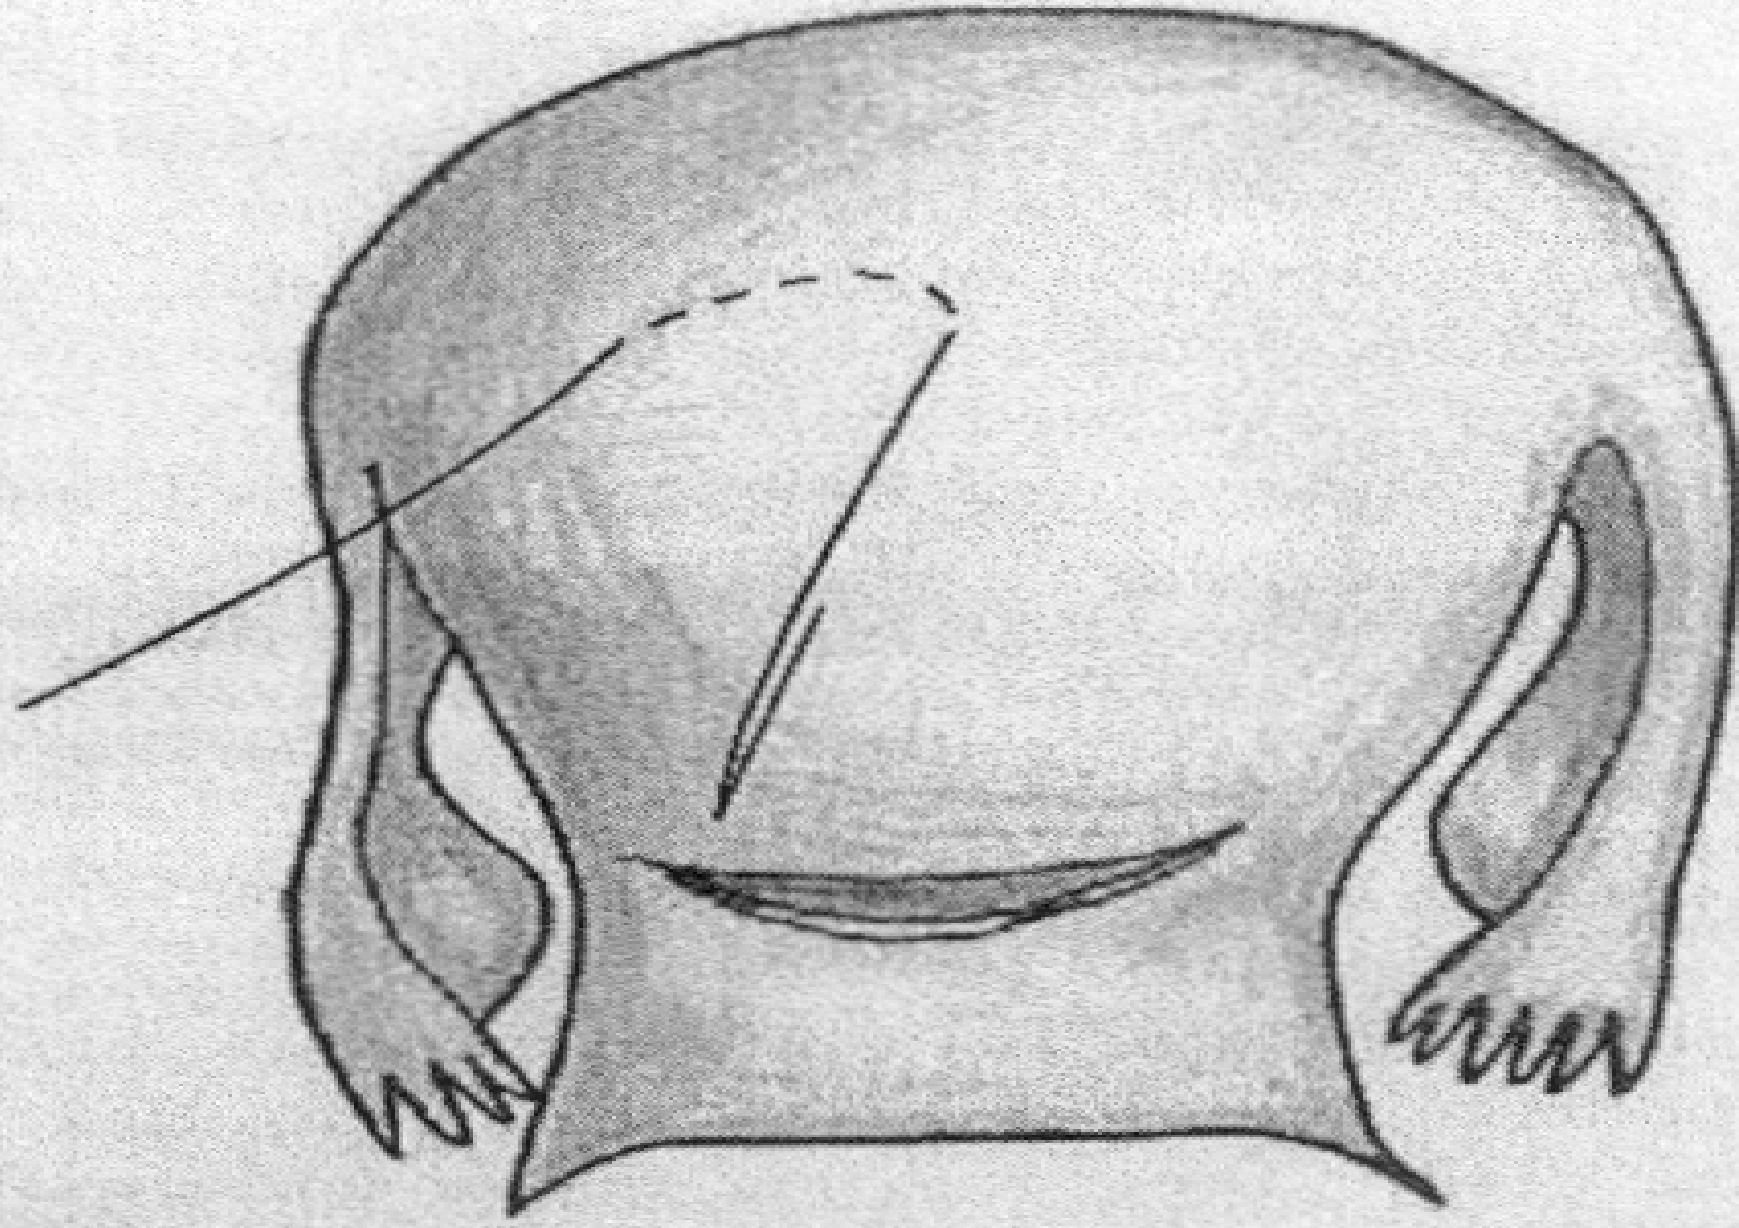

Figure 1. Hemostatic multiple square suture method.

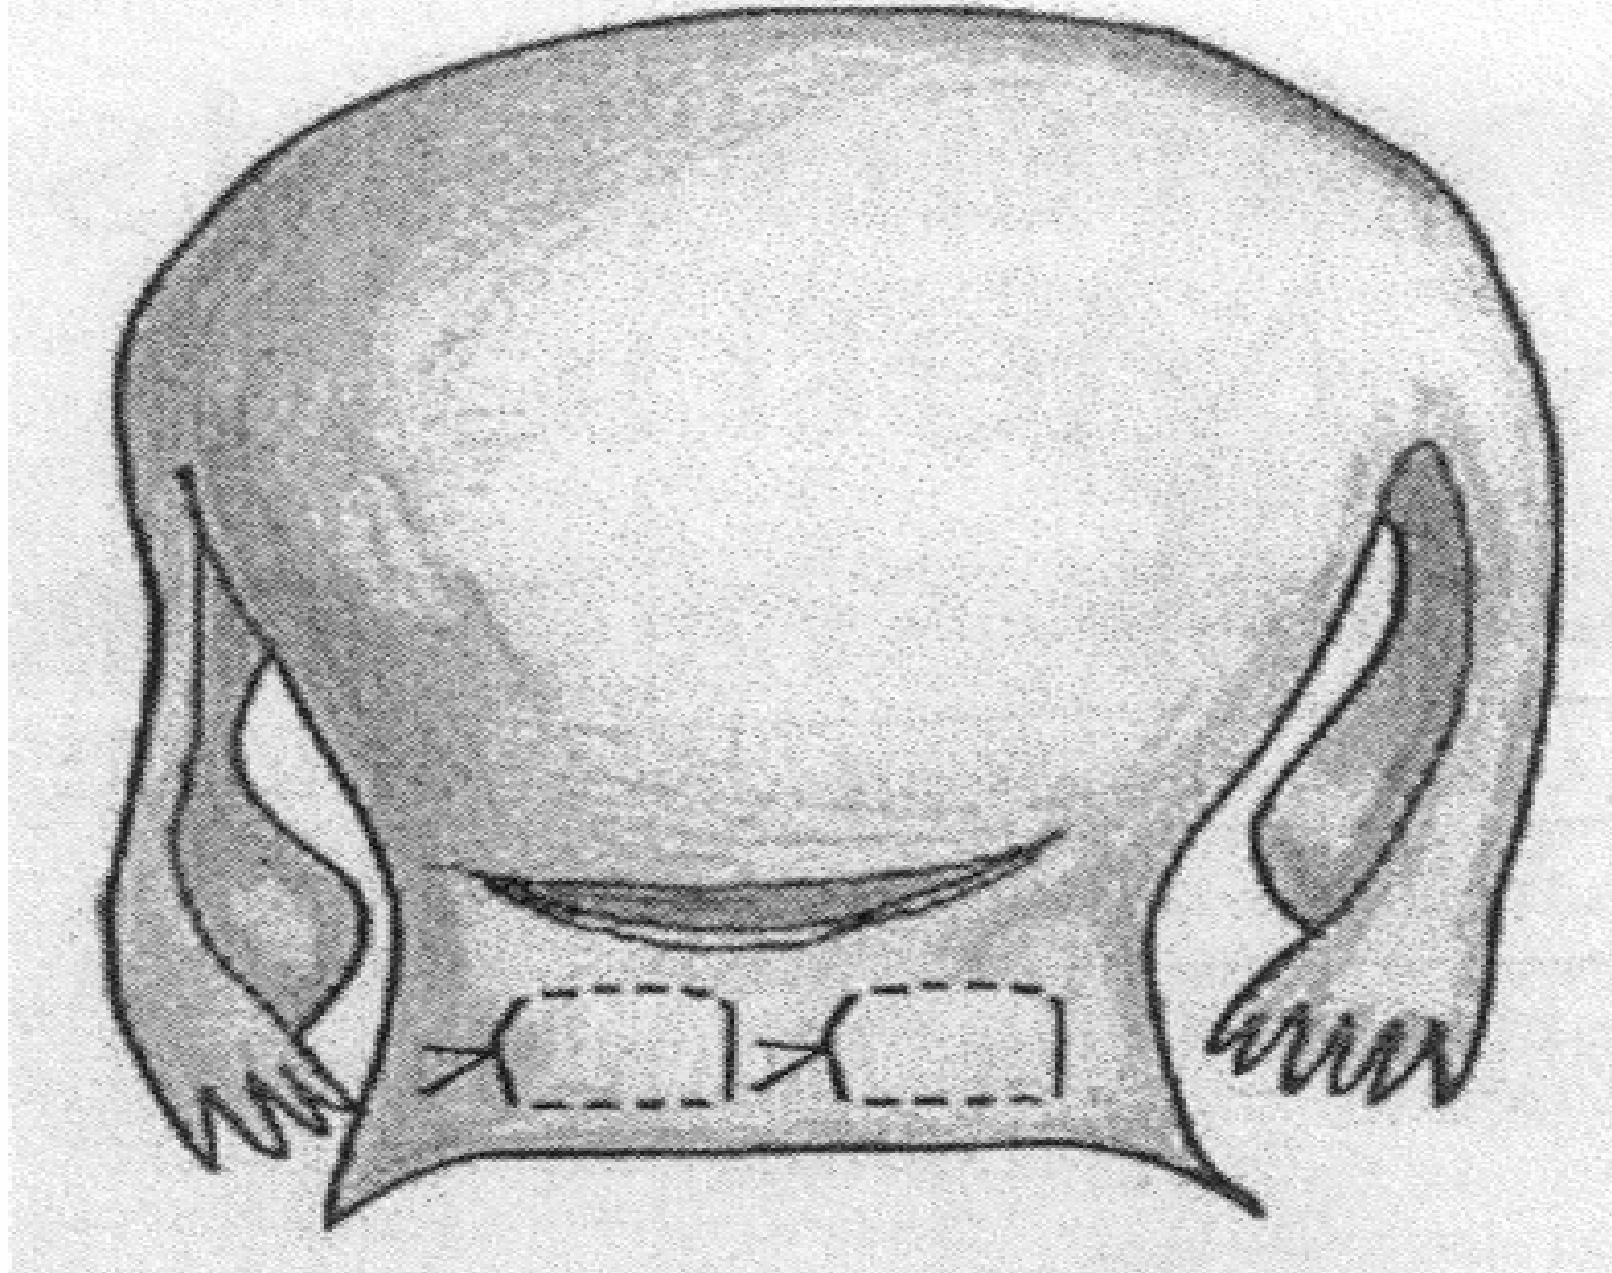

Figure 3. Bleeding because of placenta previa or accreta.

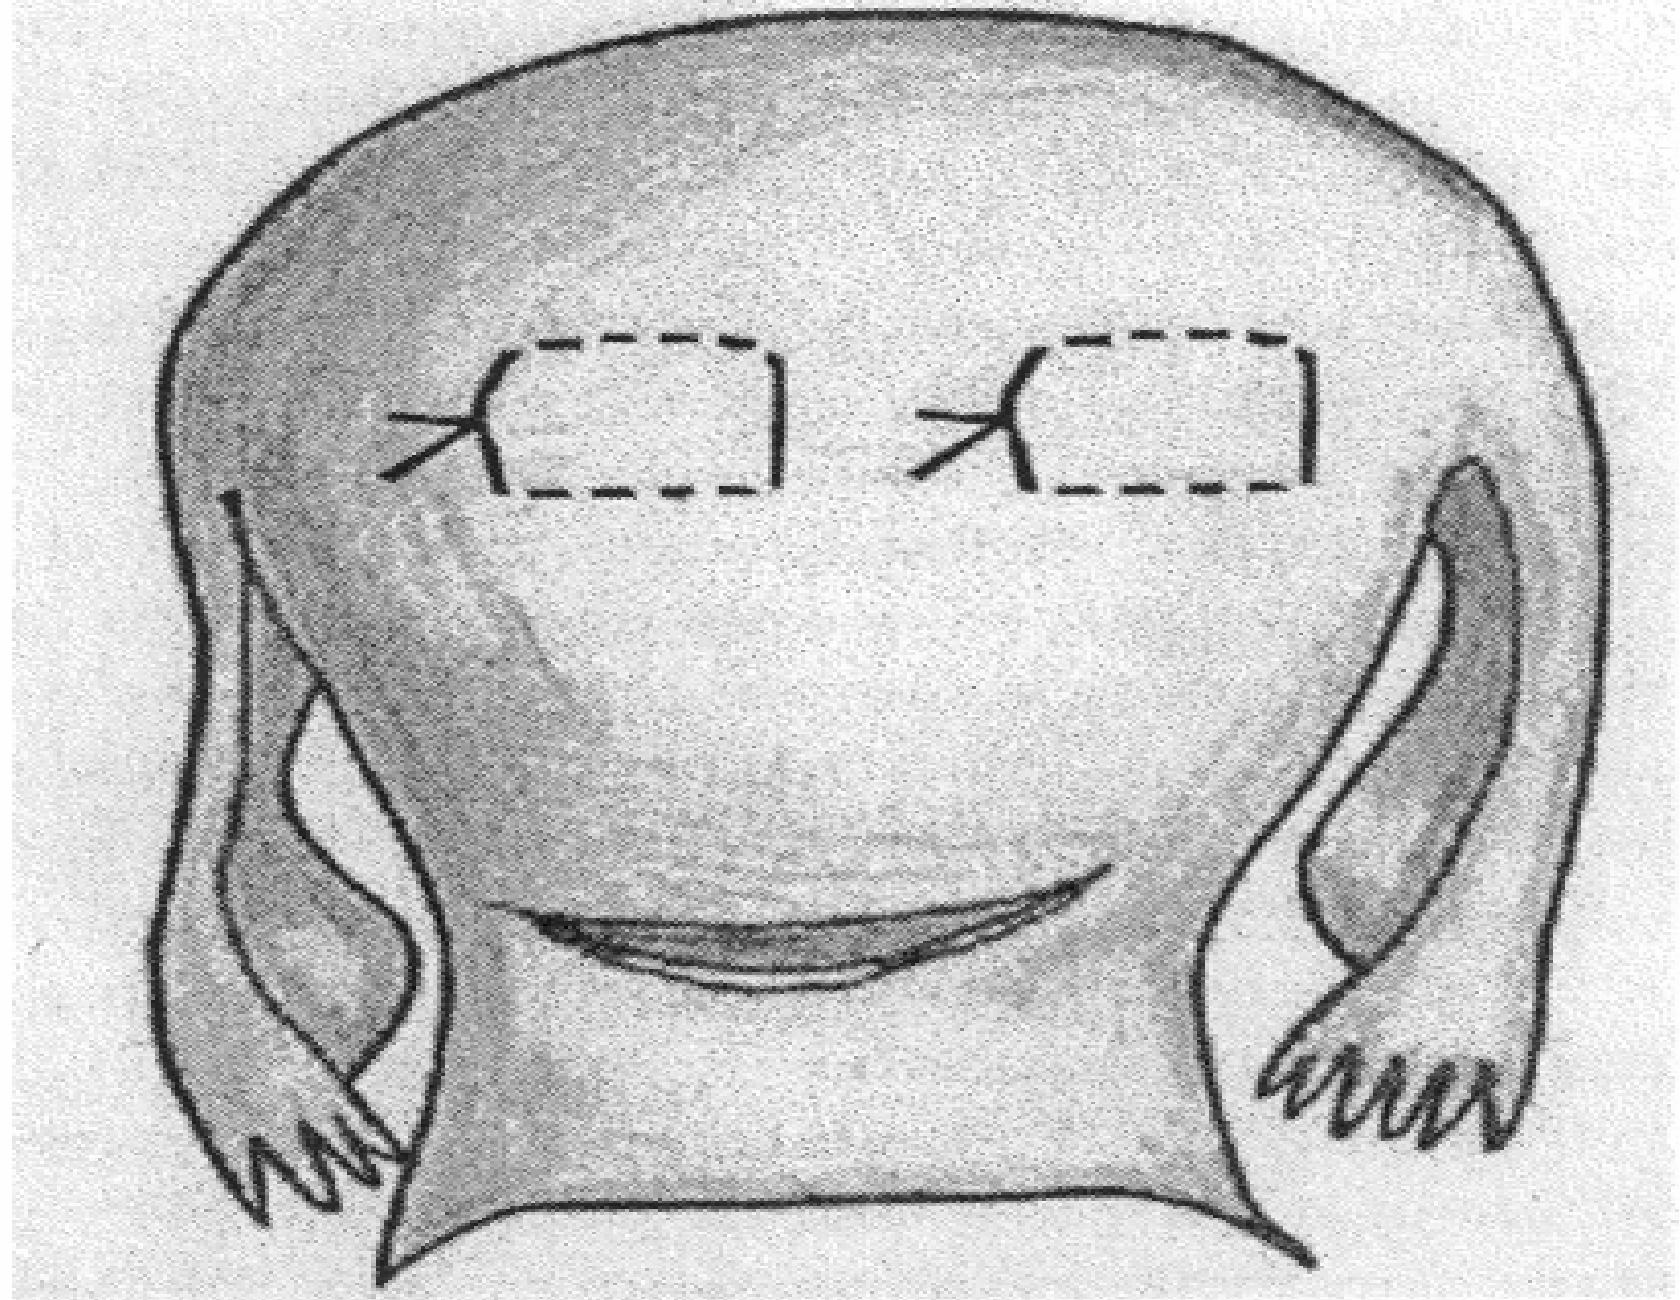

Figure 2. Bleeding because of uterine atony or placenta accreta.

Maternal Mortality

- Placenta Accreta -

Clinical Risk Factors

- Placenta previa
- Previous C/S
- Adv maternal age

Sonographic markers

Biochemical markers

Suspect Placenta accreta

Maternal Mortality

- Placenta Accreta -

Classic management

Cesarean Section

Attempt Placental removal → Hemorrhage

- Local sutures*
- Uterine artery ligation*
- Embolization*
- TAH*

Maternal Mortality

- Placenta Accreta -

Classic management

- Significant blood loss
- MOF (*ARDS, DIC, ARF*)
- Injury to other organs -*Bladder, Urether*
- Need for Hysterectomy

Maternal Mortality

- Placenta Accreta -

A survey of members of SPO identified 109 cases of placenta accreta.

- *Antepartum Dg suspected in 50%.*
- *Management*

Surgical 93%

Conservative 7%

- *Maternal Mortality 8 (7%)*

- *Maternal Morbidity*

Transfusions 90%

Massive transfusion (>10u.) 40%

Serious infections 28%

Maternal Mortality

- Placenta accreta -

Objective

A group of patients suspected of having Pl. accreta and managed conservatively was compared with a similar group of patients that delivered during the same time interval but were managed in a traditional fashion

Maternal Mortality

- Placenta Accreta -

Conservative approach

Amnio at 37wks gestation for FLM

Day of C/S catheters are placed in the abd. aorta

Intraop : - Sono maps the position of the Placenta
-Uterine incision just above placental edge
(High transverse incision)

Maternal Mortality

- Placenta Accreta -

Conservative approach

Delivery of infant:

- Leave placenta intact
- Insure hemostasis of uterine incision

Selective embolization of the uterine arteries under fluoroscopic guidance (20-25 min)

Maternal Mortality

- Placenta Accreta -

Conservative approach

Succesful embolization

Attempt made to remove placenta

\oplus Pl accreta

\emptyset Pl accreta

Leave placenta in situ

Remove placenta

Maternal Mortality

-Placenta Accreta -

Conservative → A total of 17 patients with the presumptive Dg of Placenta accreta were managed in this fashion.

Traditional → A total of 18 ptients were managed by removing placenta first then insuring hemostasis .

Maternal Mortality

-Placenta Accreta -

Group 1.

n=13

Embolized; Placenta left

→ *Entire PI → 6pat*

→ *Part of PI → 7pat*

Group 2.

n=2

Embolized; Placenta removed (No PI accreta)

Group 3.

n=2

Not Embolized

*Ut incision through PI
→ Bleeding → TAH*

Maternal Mortality

- Placenta Accreta -

<u>Group</u>	<u>Blood Tr</u>	<u>Massive Blood Tr</u>	<u>TAH</u>
Traditional (n=18)	13(72%)	8(44%)	11(61%)
Conservative (n=15)	5* (33%)	1** (6%)	2(12%)

*2 pat → Medical reasons for transfusion

**attempt for vaginal removal of placenta 2mo PP

Maternal Mortality

-Placenta Accreta -

Objective

A retrospective comparison of a new "conservative" approach to the classic management of Placenta accreta

Kayem et al Ob-Gyn 2004

Maternal Mortality

-Placenta Accreta -

Conservative → A total of 20 patients had their Placenta left in situ after Dg of PI accreta. UAE not done routinely

Traditional → A total of 13 ptients were managed by removing placenta first then insuring hemostasis .

Maternal Mortality

- Placenta Accreta -

<u>Group</u>	<u>Blood Tr</u>	<u>Massive Blood Tr</u>	<u>TAH</u>
Traditional (n=13)	12(92%)	8(38%)	11(85%)
Conservative (n=20)	16 (80%) ^{ns}	1 (5%)*	3(15%)*

*p< 0.05

Kayem et al Ob-Gyn 2004

Maternal Mortality

- Placenta Accreta -

Intraoperative management

1.-Map exact position of placenta → Make high transverse uterine incision to avoid cutting through placenta

2.- Deliver fetus → Rapid hemostasis of uterine incision (clamps, sutures)

Definitive Rx

↓
Do not remove pl

↓
TAH

Dg uncertain

↓
UAE

↓
Remove pl

Avoid TAH

↓
UAE

↓
Leave Pl in situ

Maternal Mortality

-Placenta Accreta -

Conservative approach

- Wants to avoid TAH (religious/cultural)
- Inability to transfuse (Jehovah's witness, etc)
- Desires subsequent pregnancies
- Significant Bladder involvement
- Tolerates poorly large hemodynamic shifts (IHSS, Eisenmenger syndrome etc)

Maternal Mortality

-Placenta Accreta -

Follow-up management

- 1.- *Ultrasound exams → Vascularity*
- 2.- *HCG titers (If → consider Mtx)*
3. *Daily Temps, Other S&S of infection*
- 4.- *Bleeding*
- 5.- *Coagulation profile*

Maternal Mortality

-Placenta Accreta -

Follow-up management

If Intervention necessary for

- Bleeding*
- Infection*
- DIC*

Proceed directly to TAH
