Table 23 - A, B, C, D	Staten Island	114-117

Introduction to the New York State HIV/AIDS Annual Surveillance Report

Overview

The Annual Surveillance Report presents recent data on newly diagnosed HIV cases and persons living with diagnosed HIV infection in New York State. Twenty-two sets of tables are grouped by major geographic division (New York State (NYS), New York City (NYC), NYS excluding NYC, Ryan White Regions¹, NYC boroughs). Most sets feature four tables on separate pages – (A) living HIV and AIDS cases, (B) new HIV diagnoses, (C) AIDS diagnoses and (D) deaths among HIV and AIDS cases. The historical table (Table 1) includes HIV and AIDS diagnoses, and deaths among persons with AIDS.

A) Living HIV (not AIDS), Living AIDS Cases and Living HIV/AIDS Cases

- The table features age-adjusted **prevalence rates** (living cases per 100,000 population) and shows the population. This allows comparison of rates between demographic groups and between geographic areas.
- Age is **current age** for the time point being reported, e.g. December 2012.

B) Newly Diagnosed HIV Cases

- **All** HIV cases newly diagnosed during the reporting period are counted, regardless of concurrent or subsequent AIDS diagnosis or vital status.
- Total new HIV diagnoses are subcategorized by AIDS diagnosis status. "Late" diagnoses are defined as HIV diagnoses followed by an AIDS diagnosis within 12 months. "Late" diagnoses are further subdivided into "concurrent" (AIDS diagnosis within one month of HIV diagnosis), or "other late" (AIDS diagnosis within 1 to 12 months). Remaining HIV diagnoses – those who have not developed AIDS to date or developed AIDS more than 12 months after HIV diagnosis are reported as "other".

¹ This report presents tabulations for eight Ryan White regions covering New York State, exclusive of New York City: Albany, Binghamton, Buffalo, Lower Hudson, Mid-Hudson, Nassau/Suffolk, Rochester and Syracuse. For administrative purposes in certain Ryan White programs, Binghamton and Syracuse Regions are combined into Central New York Region, and Mid Hudson and Lower Hudson are combined into Hudson Valley Region,

- Age-adjusted **case rates** (cases per 100,000 population per year) are given for new HIV diagnoses.
- Late and concurrent diagnoses are also presented as a percent of total new HIV diagnoses.

C) Newly Diagnosed AIDS Cases

- Age-adjusted case rates are given.

Cumulative AIDS cases are shown next to new AIDS diagnoses.

D) Deaths among HIV and AIDS Cases

- Deaths from all causes are shown separately for HIV, AIDS and total cases

Observations from the Current Report

- As of December 2012 over 132,000 New Yorkers were living with HIV/AIDS. While the burden of HIV is heaviest in New York City, 21 percent of persons living with diagnosed HIV infection resided outside the five boroughs at the time of diagnosis.
- Statewide, **23 percent** of newly diagnosed HIV cases have a **concurrent AIDS diagnosis**, and an additional **6 percent** show an AIDS diagnosis within 12 months.
- The tabulation of living cases by current age shows that HIV/AIDS should no longer be thought of as a young persons' disease. While the majority of HIV diagnoses occur before age 40, **77 percent of persons living with diagnosed HIV infection are over age 40 and 47 percent are age 50 or older.**
- In New York State HIV disproportionately affects minority populations. The rates of new HIV diagnoses among Blacks and Hispanics are 7.4 and 5.7 times higher, respectively, than the rate for Whites, and the prevalence rates are 8.2 and 5.8 times higher, respectively.

Technical Notes on the New York State HIV/AIDS Annual Surveillance Report

Introduction

This HIV/AIDS Annual Surveillance Report is produced by the Bureau of HIV/AIDS Epidemiology (BHAЕ), AIDS Institute, New York State Department of Health (NYSDOH). Access to this publication is available through the Internet at the following address:

<http://www.nyhealth.gov/diseases/aids/statistics/index.htm>.

Printed copies can be obtained by contacting:

Division of Epidemiology, Evaluation and Research

P.O. Box 2073, ESP Station

Albany NY 12220-0073

(518) 474-4284

bhae@health.ny.gov

Information presented in this report is generated from data collected and maintained by BHAЕ and the HIV Epidemiology and Field Services (HEFS) Program of the NYC Department of Health and Mental Hygiene (NYCDOHMH). More finely delineated breakouts may be obtained through the BHAЕ data request unit by calling the above phone number or email address.

Source Data

This report was produced using the April 2014 BHAЕ Statewide Analysis file. The Analysis file combines surveillance data from the New York State and New York City HIV/AIDS surveillance registries.

Reporting Procedures

On June 1, 2000, the NYSDOH implemented the HIV Reporting and Partner Notification Law (Chapter 163 of the Laws of 1998, PHL 21 Title III). This law enhanced the existing AIDS case reporting by requiring health care providers to report all initial determinations of HIV infection,

HIV-related illness and AIDS to the NYS Commissioner of Health.² Under the amended HIV testing law (Chapter 308 of the Laws 2010), providers are required to report such determinations within 14 days of receipt of positive laboratory result or after diagnosis, whichever is sooner. Until June 2005, laboratories were required to report all confirmatory HIV antibody tests, all detectable viral loads and all CD4<500 cells/mm³ or 29% of total lymphocytes. As of June 2005, all viral load and CD4 tests are reportable, as well as confirmatory HIV antibody tests and genotype results of antiretroviral drug resistance tests. In 2010, laboratory reporting requirements were broadened to include electronic reporting of any laboratory test, tests or series of tests approved for the diagnosis of HIV or for the periodic monitoring of HIV infection.

Laboratories conducting HIV-related testing must report directly to the NYSDOH. For more information call 518-474-4284.

All NYS providers should report using the NYS Confidential Medical Provider HIV/AIDS and Partner/Contact Report Form (PRF) DOH-4189 Revised 03/09. Copies can be obtained by calling 518-474-4284. Additional information about provider reporting is available at <http://www.health.ny.gov/diseases/aids>.

NYS providers **outside** of NYC should mail the completed PRF to:

Division of Epidemiology, Evaluation and Research
P.O. Box 2073, ESP Station
Albany, New York 12220-0073

NYC providers should call (212) 442-3388 to arrange pickup of the completed PRF.

Record Updates:

HIV/AIDS surveillance files are never closed. When additional information is received on a case after the initial confirmation, data for that case may be updated, resulting in changes in the data reported to the public. For example, new information may indicate that two surveillance cases in

² HIV-infected patients diagnosed with tuberculosis (TB) are also reportable to the local TB control program. Questions regarding TB reporting should be directed to your local program or the NYS TB Control Program at (518) 474-4845.

fact refer to a single individual. Surveillance system records for the two cases will be combined, reducing the case count for the geographic area, demographic or risk group of the combined cases.

HIV/AIDS Surveillance Case Definition:

A uniform surveillance case definition for AIDS was established by the Centers for Disease Control and Prevention (CDC) in the early 1980s, and has since been modified three times to expand the range of AIDS-indicator diseases and conditions and to incorporate HIV diagnostic tests. Modifications in 1985 and in 1987 were followed by the 1993 expansion of the AIDS case definition for adults and adolescents, which includes HIV-infected individuals with CD4+ T-lymphocyte counts below 200 cells/mm³ or below 14 percent of total lymphocytes, and individuals diagnosed with pulmonary tuberculosis, recurrent pneumonia or invasive cervical cancer.

Particularly due to the new immunologic criterion of the expanded case definition, the number of cases reported to the NYSDOH and NYCDOHMH grew immensely following the 1993 modification. The immunologic criterion permitted a substantial number of AIDS diagnoses to be made before the occurrence of the first opportunistic condition. These cases were effectively diagnosed earlier in the spectrum of HIV disease than other AIDS cases diagnosed under the old case definition. The effect of this new criterion was to create a large and sudden increase in the number of AIDS cases confirmed around 1993, producing the false impression of a dramatic increase in AIDS cases during that period.

In 2008 CDC revised the HIV case definition³, designating AIDS as “stage 3 HIV infection.” This Annual Report continues to use the term AIDS to refer to this stage of disease. The 2008 case definition also requires laboratory-confirmed evidence of HIV infection. Since virtually all HIV cases entered into the NYS surveillance system meet this requirement it did not materially affect case counts.

³ Revised Surveillance Case Definitions for HIV Infection Among Adults, Adolescents, and Children Aged <18 Months and for HIV Infection and AIDS Among Children Aged 18 Months to <13 Years — United States, 2008;MMWR, Dec. 5 2008, vol. 57, No. RR-10

In April, 2014, CDC again revised the HIV case definition⁴. Under the 2014 definition, (1) adult and pediatric definitions are covered under a single rubric; (2) “stage 0 HIV infection” is used to denote cases with a negative HIV test within 6 months of diagnosis; (3) laboratory criteria for “stage 3 HIV infection” refer to CD4 + T-lymphocyte percentage only if CD4+ T-cell counts are not reported; and, (4) laboratory criteria for defining a confirmed case now accommodate the multitest algorithm which entered widespread use in 2013. The new case definition went into effect after the preparation of data for this report and is not reflected in these tabulations.

Deduplication:

The HIV/AIDS case data used in this Annual Report have undergone both inter- and intra-state deduplication.

In 2004 the CDC completed the Interstate Duplication Evaluation Project (IDEP) in which all states were required to participate. The purpose of the project was to identify duplicate cases of HIV/AIDS that have been reported to the National HIV/AIDS Surveillance System by one or more states and assure that the cases were only counted once. If a case was reported by two or more states, the earliest date of diagnosis was used to determine which state the case was assigned to. CDC's deduplication of HIV/AIDS cases, now known as Routine Interstate Duplicate Review (RIDR), is conducted on an ongoing basis. Cases in the New York registry that are known through RIDR to have been initially diagnosed while resident in another state are excluded from the Annual Report.

The Annual Report case data have also been deduplicated between NYC and the rest of NYS. In all areas of NYS excluding NYC, HIV/AIDS surveillance is conducted by the NYSDOH's BHAIE. In NYC, HIV/AIDS surveillance is conducted by the NYCDOHMH HEFS Program. Often, the same case will be reported to both jurisdictions. The NYC and NYS departments of health report HIV/AIDS data separately to CDC, and the combined file can contain certain cases twice. At the national level, CDC deduplicates the data between the two jurisdictions for its own use. The goal of CDC's process is to ensure that each case is only counted once and is credited to the case's state of residence at the time of the earliest report. This deduplicated count provides the basis for Ryan White and other federal funding received by NYS. The data used in this

⁴ Revised Surveillance Case Definition for HIV Infection — United States, 2014; MMWR, Apr. 11, 2008, vol. 63, No. 3

report have been deduplicated by BHAЕ following an algorithm similar to that used by CDC. Since May 2010, BHAЕ has also performed further adjustments to the data using information from an intrastate extension of the RIDR process. This removes several hundred additional duplicate records, but, importantly, returns to the analysis file some 3,000 unique cases that are excluded by the base procedure.

On-going refinement of the data may also contribute to geographical reassignment of cases at the state, regional and/or county and local levels.

Age Adjustment:

The diagnosis and prevalence rates for total population, sex and race/ethnicity in the report are age-adjusted to the U.S. 2000 Census population. The purpose of the adjustment is to enable comparisons of rates between areas or demographic groups which differ in age structure. In general, the adjusted rates in this report are similar to the crude (unadjusted) ones. Readers interested in the crude rates may derive them by dividing the case counts by the 2012 populations (National Center for Health Statistics, Bridged-Race Vintage 2012 Postcensal File, Released 2013.) which are given in the Living Cases table for each geographic region.

Data Completeness:

Newly diagnosed HIV and AIDS cases: Historical data indicate that counts of new HIV and AIDS diagnoses are approximately 95% complete by one calendar year after the close of the reporting period.

Living HIV and AIDS Cases: Because living cases include cases diagnosed in previous years as well as newly-diagnosed cases, delays in case reporting and ascertainment have little practical effect on the count. However, counts of living cases may be affected by delays in death reporting and incompleteness of matching death records to surveillance data.

Definition of Terms Used in this Report

Case: “Case” refers to a report for which confirmatory clinical and demographic data required by the CDC have been obtained. Reports received without sufficient information to confirm the suspected case or a confirmed case reported without required demographic or other key variables, including risk factors, are investigated by NYS or NYC staff who examine medical records to confirm case status, obtain demographic information, clinical status and reported HIV exposure (risk).

HIV and AIDS Case Categories:

- ***Living HIV Cases*** - All reported individuals living with HIV infection who have not developed AIDS. This category includes HIV cases identified through laboratory report of a positive test result from an approved diagnostic test and/or reported by a provider indicating an HIV diagnosis or an HIV illness.
- ***Newly Diagnosed HIV Cases*** - HIV cases that have been reported for the first time by a laboratory reporting a confirmatory test result or by a physician reporting an initial HIV diagnosis, regardless of concurrent or subsequent AIDS diagnosis. Although DOH staff seek to obtain an accurate diagnosis date, please note that HIV reporting began in June 2000, so cases diagnosed before then by a provider other than the provider reporting the case may be misclassified as newly diagnosed. (See **Diagnosis date**, below.)
- ***Living AIDS Cases*** - All reported living individuals who have ever met CDC criteria for Stage 3 HIV disease (AIDS).
- ***Newly Diagnosed AIDS Cases*** – Cases reported with AIDS for the first time. This includes new HIV cases concurrently diagnosed with AIDS and cases initially reported with HIV infection that have subsequently developed AIDS.
- ***Cumulative AIDS Cases*** - All AIDS cases reported since 1983, both living and deceased. There is no corresponding category for HIV cases.

Diagnosis date: The diagnosis date refers to the earliest date on which a clinical or laboratory diagnosis of HIV and AIDS is documented on a provider report form, laboratory report or in the patient's medical chart. This date may be months, or even years, earlier than the date the case was reported to the health department. The date of diagnosis is unrelated to the timing of

initial infection or disease acquisition.

HIV Exposure Category: Information on possible mode(s) of HIV exposure is typically gathered by health care providers during routine medical history taking and is obtained from review of the patient's medical records, or may be obtained during routine follow-up for Partner Services. An individual could have been exposed to HIV through more than one route. However, for the purpose of surveillance, only one exposure mechanism is considered. (The category of "men who have sex with men and inject drugs" is the only exception to this.) Persons identified with more than one potential exposure route are classified in accordance with the following CDC-defined hierarchy of exposure category:

Adults:

- Men who have sex with men and inject drugs
- Men who have sex with men (includes bisexual men)
- Injection drug users
- Hemophiliacs or persons with other clotting disorders
- Heterosexual contact with an injection drug user, a bisexual man, a hemophiliac, an HIV-positive blood product recipient, or a person with documented HIV or AIDS
- Transfusion or transplant recipient
- Confirmed other risk
- Female presumed heterosexual contact
- Adult with undetermined mode of exposure

Children:

CDC categorizes a case as "pediatric" if the diagnosis was made before age 13.

- Hemophiliacs or children with other clotting disorder
- Mother is an injection drug user
- Mother had sex with an injection drug user, a bisexual man, a hemophiliac, an HIV-positive blood transfusion recipient, an individual with documented HIV or AIDS
- Mother received a transfusion or blood products
- Mother had AIDS or is HIV-positive

- Transfusion or transplant recipient
- Pediatric other risk
- Child with undetermined mode of exposure

Based on this hierarchy, for example, a woman who may have been exposed to HIV through both injection drug use and through heterosexual contact with an HIV-infected partner would be classified only as an injection drug user, since that mode of exposure is ranked higher than heterosexual contact on the hierarchy.

Under the standard CDC risk hierarchy, an individual for whom all but heterosexual HIV risk has been ruled out can be classified as heterosexually exposed only if the partner's risk and/or HIV status is documented. In the absence of such information, the case is classified as having an undetermined exposure category. In contrast, men who have sex with men and injection drug users need only be behaviorally identified in one of these groups, with no additional documentation required. As a result of the more rigorous standards for identifying heterosexually exposed individuals, it is likely that many heterosexually exposed cases fail to meet these standards. The Female Presumed Heterosexual Contact categorization addresses this issue in women whose surveillance record indicates heterosexual activity. There is no corresponding classification for males; thus, a proportion of male cases with an undetermined exposure category may be heterosexually exposed.

Individuals with an undetermined mode of exposure may fall into one of several categories: persons currently under investigation by public health representatives, persons for whom no mode of exposure was identified because the individual died or was lost to follow-up, persons with lack of exposure information in his/her medical chart, and persons for whom adequate follow-up information revealed no identifiable exposure mechanism.

Age:

Age at Diagnosis: The individual's age at the initial diagnosis of the condition in question (i.e. HIV or AIDS). As noted above, CDC categorizes a case as "pediatric" if the diagnosis was made before age 13.

Current Age: The individual's age at the end of the reporting period.

Living Cases: Vital status of cases is determined from updated case reports, medical record review, death certificate files maintained by the NYSDOH and NYCDOH Vital Records, from Social Security Death master File and the National Death Index. Unless known to be deceased from these sources, cases are presumed to be alive.

Prisoners: Cases categorized as "Prisoners" have been diagnosed while incarcerated or reported in city or county jails or one of the NYS Department of Corrections and Community Supervision (DOCCS) facilities throughout NYS. Most prisoner reports come from a NYSDOCCS facility. Prison cases are often presented separately from general population data because, if diagnosed while incarcerated, residence reflects the address of the correctional facility, rather than the pre-incarceration home address. In this report, tabulations for the whole state, NYC and its boroughs, and NYS excluding NYC (Tables 4A, 4B and 4C) include prisoners. In other geographic areas, prisoners make up a significant but shifting proportion of cases, and are excluded from those tables. Refer to table titles and footnotes to determine inclusion or exclusion of prisoner cases.

Residence: In this report, new HIV and AIDS diagnoses are presented by county of residence at the time of diagnosis, as reported in the surveillance record. Similarly, living AIDS cases are assigned to the county of residence at AIDS diagnosis. Living HIV cases diagnosed with AIDS after the close of the report period are presented by county of HIV diagnosis. For example, a case diagnosed with HIV in Albany County in 2010 and diagnosed with AIDS in Monroe County in 2012, would be included among living HIV cases in Albany County in the annual report for December 2011.

Guide to the Tables

Most of the tables in this report are in one of three formats: (A) Living Cases, (B) Newly Diagnosed HIV Cases, (C) Newly Diagnosed and Cumulative AIDS Cases or (D) Deaths among HIV and AIDS Cases. Each geographic region – State, substate (NYC, NYS excluding NYC), Ryan White Region, NYC borough – is represented by a set of four tables, one in each format. These main formats are presented in detail below.

Counties:

Except for the boroughs of NYC, individual counties lack sufficient cases for statistically reliable display in the main table format. The county tables (5A, 5B) show new and living cases without demographic breakouts. Readers may contact BHAЕ to obtain more detailed county information.

Prisoners:

The tables for NYS excluding NYC by sex (Tables 7A-7F) and the Ryan White Regions exclude prisoners, as noted in the table titles. The prisoner tables (8A, 8B) show persons identified as prisoners in state correctional facilities outside NYC. Because of the way cases are reported, the county of residence of these cases reflects the county of incarceration at the time of diagnosis or first report, which may differ from the individual's home county and later county of incarceration. Since the movement of prisoners between facilities is not recorded in the HIV surveillance system, accurate county and regional tabulations of inmates living with diagnosed HIV infection cannot be developed using HIV surveillance data. The county tables (5A, 5B) and Ryan White Region summary tables (9A, 9B) present counts both with and without prisoners in order to show the general effect of prisoners on case counts at the county level.

Guide to the Tables

The "A" Tables (Example: Table 2A)

Table 2A

NEW YORK STATE: Includes all 62 Counties
Living HIV and AIDS Cases as of December 2012, by Sex at Birth, Age, Race/Ethnicity and Risk

		Living HIV (not AIDS) Cases			Living AIDS Cases			Living HIV and AIDS Cases			Area Population
		Number	Percent	Prevalence Rate*	Number	Percent	Prevalence Rate*	Number	Percent	Prevalence Rate*	
Total		52,912	100.0	265.2	79,262	100.0	373.8	132,174	100.0	639.0	19,570,261
Sex at Birth	Male	37,105	70.1	381.3	55,746	70.3	542.0	92,851	70.2	923.3	9,489,217
	Female	15,807	29.9	155.0	23,516	29.7	218.7	39,323	29.8	373.7	10,081,044

Living Cases: Persons living with HIV (not AIDS) and AIDS at the end of the report period (in this case December 2011). These are summed to produce a total count of people living with HIV/AIDS.

Prevalence Rate: The number of living cases per 100,000 population, age-adjusted to the U. S. 2000 Census population. The purpose of age-adjustment is to allow comparison of rates among populations with differing age distributions. The crude (unadjusted) rate can be derived by dividing living cases by the area population. In the example above, the crude prevalence rate of total living HIV and AIDS cases in NYS is $(132,174 \div 19,570,261) \times 100,000 = 675.4$ per 100,000, somewhat higher than the age-adjusted rate of 639.0 per 100,000.

Area Population: National Center for Health Statistics, Bridged-Race Vintage 2012 Postcensal File. (Released 2013.)

Guide to the Tables

The "B" Tables (Example: Table 2B)

Table 2B

NEW YORK STATE: Includes all 62 Counties
HIV Cases, Newly Diagnosed (January-December 2012), by Sex at Birth, Age, Race/Ethnicity and Risk

		Late Diagnoses (AIDS within 1 yr of HIV diagnosis)						Other HIV Diagnoses		All HIV Diagnoses*			Percent of All HIV Diagnoses	
		Concurrent HIV&AIDS (A)		Other Late (B)		All Late (C=A+B)		(D)		(E=C+D)			Concurrent (A+E)*100	All Late (C+E)*100
		#	%	#	%	#	%	#	%	#	%	Case Rate**	%	%
Total		765	100.0	188	100.0	953	100.0	2,363	100.0	3,316	100.0	16.7	23.1	28.7
Sex at Birth	Male	592	77.4	144	76.6	736	77.2	1,837	77.7	2,573	77.6	26.4	23.0	28.6
	Female	173	22.6	44	23.4	217	22.8	526	22.3	743	22.4	7.3	23.3	29.2

HIV Diagnoses: All newly diagnosed HIV cases, regardless of concurrent or subsequent AIDS diagnosis. Some of these cases may *also* be diagnosed with AIDS during the reporting period (in this case, January-December 2012), and those AIDS diagnoses will be reported in the accompanying AIDS diagnosis table (Table 2C).

Late Diagnoses: Late diagnoses are defined as those with an AIDS diagnosis within 12 months of the HIV diagnosis.

Concurrent HIV & AIDS: Newly diagnosed HIV cases with an AIDS diagnosis within a month of the HIV diagnosis date.

Other Late: Newly diagnosed HIV cases with an AIDS diagnosis 2 to 12 months after the HIV diagnosis date.

Other HIV Diagnoses: Newly diagnosed HIV cases without a subsequent AIDS diagnosis or with an AIDS diagnosis more than 12 months after the HIV diagnosis date. Such AIDS diagnoses would not be shown in this report since they occur after the calendar year covered by the report.

Case (diagnosis) Rate: The number of newly diagnosed cases per 100,000 population, age-adjusted to the U. S. 2000 Census population. The purpose of age-adjustment is to allow comparison of rates among populations with differing age structures. The crude (unadjusted) rate can be derived by dividing new diagnoses by the area population. Following the previous example, the crude diagnosis case rate in NYS is $(3,316 \div 19,570,261) \times 100,000 = 16.9$ per 100,000, almost the same as the age-adjusted rate of 16.7 per 100,000.

Percent Concurrent: The percent of newly diagnosed cases that are also diagnosed with AIDS within one month of the HIV diagnosis date.

Percent Late: The percent of newly diagnosed cases that are also diagnosed with AIDS within twelve months of the HIV diagnosis date. This includes concurrent diagnoses.

Guide to the Tables

The "C" Tables (Example: Table 2C)

Table 2C

NEW YORK STATE: Includes all 62 Counties
AIDS Cases, Newly Diagnosed (January-December 2012)
and Cumulative (through December 2012) by Sex at Birth, Age, Race/Ethnicity and Risk

		AIDS Diagnoses*			Cumulative AIDS Diagnoses	
		Number	Percent	Case Rate**	Number	Percent
Total		2,370	100.0	11.9	200,019	100.0
Sex at Birth	Male	1,705	71.9	17.5	147,949	74.0
	Female	665	28.1	6.5	52,070	26.0

AIDS Diagnoses: AIDS diagnoses may occur among persons newly diagnosed with HIV (i.e., within the report period) as well as among those diagnosed earlier. HIV diagnoses and AIDS diagnoses **cannot** be added in a meaningful way.

For concurrent cases with an HIV diagnosis in the last month of the reporting period, the accompanying AIDS diagnosis may occur in the next reporting period. For example, some concurrent cases diagnosed with HIV December 2012 were diagnosed with AIDS in January 2013. The January-December 2012 report will not count their AIDS diagnosis in this table; on the other hand, it *will* count the AIDS diagnoses of some concurrent cases diagnosed with HIV in December 2011. This is of little practical significance.

Case Rate: The AIDS case (diagnosis) rate is calculated the same way as the HIV case (diagnosis) rate (see Guide to "B" Tables).

Guide to the Tables

The "D" Tables (Example: Table 2D)

Table 2D

NEW YORK STATE: Includes all 62 Counties
Deaths Among HIV and AIDS Cases (January-December 2012), by Sex at Birth, Age, Race/Ethnicity and Risk

		Deaths Among HIV Cases		Deaths Among AIDS Cases		Total Deaths	
		Number	Percent	Number	Percent	Number	Percent
Total		328	100.0	1,653	100.0	1,981	100.0
Sex at Birth	Male	227	69.2	1,142	69.1	1,369	69.1

Deaths Among HIV Cases: Deaths among persons with HIV-only diagnosis, regardless of cause of death.

Deaths Among AIDS Cases: Deaths among persons diagnosed with AIDS, regardless of cause of death.

Total Deaths: This sum of the deaths among HIV and AIDS cases represents the total number of persons with diagnosed HIV infection for whom NYSDOH obtained a death report.

NEW YORK STATE: Includes all 62 Counties
Newly Diagnosed HIV and AIDS Cases by Region and Year of Diagnosis
and Deaths Among Persons Living with HIV or AIDS by Region and Year
